

RUGUMAHO BLOG

Email Routing, Workflows & Configuration Guide
Strictly Confidential | Prepared for Ariane Rugumaho

1. Email Infrastructure Architecture

The email operations of the Rugumaho blog platform are divided into two main layers: **Outgoing (Sending)** which triggers notifications to you and welcome letters to your subscribers, and **Incoming (Receiving)** which routes reader replies to your personal administrator inbox.

- **Outgoing Platform (Resend Email):** Next.js backend server code connects to Resend via API tokens to send all notifications, form contents, and newsletters. Outbound emails dispatch from the domain `@rugumaho.com`.
- **Incoming & Forwarding (Cloudflare Email Routing):** Since Resend does not host mail inbox servers, any email sent by readers to `hello@rugumaho.com` is intercepted by Cloudflare DNS routers and silently forwarded to your primary Gmail address.
- **Target Destination (Google Gmail):** The central destination mailbox where all notifications, comments, contact forms, and reader correspondence land is `arianeblogger@gmail.com`.

2. Automated Outbound Email Flows

Here is how each automated email is triggered by the blog and where it is routed:

Trigger Event	Email Sender Address	Recipient	Purpose / Details
1. Newsletter Sign-up	Urukundo Rugumaho <hello@rugumaho.com>	The Subscriber	Delivers the automated welcome greeting message.
2. Contact Form Submitted	Rugumaho Contact Form <hello@rugumaho.com>	arianeblogger@gmail.com	Relays visitor's name, email, subject, and message details.
3. Comment Pending Moderation	Rugumaho Blog Alerts <alerts@rugumaho.com>	arianeblogger@gmail.com	Alerts admin to approve/reject comments in the dashboard.
4. Newsletter Campaign	Urukundo Rugumaho <hello@rugumaho.com>	Entire Subscriber List	Broadcasts campaign draft directly to all subscribers.

3. Email Credentials Details

Use the master coordinates below to access your administrator inbox and monitor all incoming emails from the blog:

Mail Account	Login Portal	Username / Address	Password
Google Gmail Inbox	gmail.com	arianeblogger@gmail.com	Ariane300@.

4. Key Operational Limitations

- **Resend Daily Send Limit:** Resend's free tier has a strict limitation of **100 sent emails per day**. If your newsletter list grows beyond 100 people, sending a campaign will hit the cap midway and fail to deliver to the rest. To resolve this, log in to your Resend account and upgrade to the \$20/month Starter tier.
- **Gmail Security Actions:** Please ensure that Two-Factor Authentication (2FA) is turned on for *arianeblogger@gmail.com*. Because all your DNS nameservers, CMS write tokens, and Vercel hosting passcodes link back to this inbox, keeping this Google account safe is critical.
