

RUGUMAHO BLOG

Project Technical Handover & Plan Limitations Guide
Prepared for Ariane Rugumaho | August 2026

1. Project Architecture Overview

The Rugumaho lifestyle journal platform is built using modern, highly optimized cloud architectures. It leverages static-site generation (SSG) for instantaneous load speeds, combined with dynamic serverless functions to handle content queries, email transmissions, and database modifications.

2. Services Powering the Project

Below is the complete inventory of the external cloud services running this project, including their currently configured subscription tiers and limits:

Service	Purpose	Tier / Plan	Monthly Limits
Next.js & Vercel	Front-end hosting, serverless edge functions, and static assets.	Hobby (Free)	100 GB Bandwidth 100 builds per day
Sanity CMS	Database storage, content schemas (posts, comments, subscribers).	Developer (Free)	10 GB Assets 500,000 API requests 100,000 documents
Resend Email	Mailing list delivery, system alert triggers, contact form relays.	Free Tier	3,000 sent emails total 100 emails max / day
ImageKit CDN	Asset host and image optimizer for covers and biography pictures.	Free Tier	20 GB Media storage 20 GB delivery bandwidth
Cloudflare	Domain DNS nameservers, SSL security encryption, email forwarders.	Free Tier	Unlimited DNS requests Free wildcard SSL certificates

3. Plan Limitations & Operational Constraints

While the free tiers of these services are more than sufficient for a launching website, you should be aware of specific constraints that may require upgrades as your brand grows:

- **Vercel (Hobby Restrictions):** The Hobby plan is designed for individual developers. Because it does not support collaboration, automatic GitHub deployments are blocked if commits are pushed by anyone other than the Vercel account owner (Ariane). To resolve this permanently, you can either upgrade to a Pro Team account (\$20/member/mo) or use the direct GitHub edit interface for quick bypasses.
- **Resend Email Sending Caps:** The Free plan has a limit of ****100 emails per day**** and ****3,000 emails per month****. If you have 200 subscribers, sending one single newsletter campaign will attempt to dispatch 200 emails, which will fail due to the daily cap. To send campaigns to lists larger than 100 subscribers, you must upgrade to Resend's *Starter Plan* (\$20/month for up to 50,000 monthly emails with no daily caps).
- **Sanity CMS Bandwidth:** If your blog attracts massive traffic (exceeding 500,000 document reads in a single month), Sanity will warn you to upgrade. The blog is configured with server-side static prerendering (SSG), meaning Google visitors read cached HTML pages rather than hitting Sanity directly. This keeps API request counts extremely low.
- **ImageKit Bandwidth:** If the site loads high-resolution cover banners for thousands of visitors, you might exceed the 20GB monthly bandwidth limit. If this happens, your images will fail to load or show placeholders. The site is optimized to compress images on the fly via ImageKit query tags (e.g. `tr=w-800,q-80`) to keep file sizes very light.

4. Technical Handoff Checklist

To transfer ownership or manage the platform in the future, ensure you have credentials for the following assets:

1. **Cloudflare:** Domain Name registrar and DNS hosting control panel.
2. **Vercel Dashboard:** Production server deployment settings and environment variables management.
3. **Sanity Project Manage:** Database backups, content document listings, and write token management (located at `sanity.io/manage`).
4. **ImageKit Console:** Private media storage buckets and URL optimization rules.
5. **Resend Dashboard:** Verification domains, webhook configurations, and API key management.

Disclaimer: All services have been successfully linked using secure tokens. Do not share the keys in your `.env.local` file, as they contain administrator write access to your content databases.
